

Problem Set 1, Part I

Problem 1: Memory management and arrays

1-1)

1-2)

12 12 7

Problem 2: Array practice

2-1)

```
public static boolean isSorted(int[] arr) {  
    if (arr == null){  
        throw new IllegalArgumentException();  
    }  
    if (arr.length == 0){
```

```
        return true;
    }

    for (int i = 1; i < arr.length; i++){
        if (arr[i] < arr[i-1]){
            return false;
        }
    }

    return true;
}
```

2-2)

```
public static void scale(int[] arr, int factor) {

    if (arr == null){
        throw new IllegalArgumentException();
    }
    if (arr.length == 0){
        return;
    }

    for (int i = 0; i < arr.length; i++){
        arr[i] = arr[i]*3;
    }

}
```

Problem 3: Recursion and the runtime stack

3-1)

mystery(20, 6)

```
a = 20
b = 6
myst_rest = mystery(14, 6) = 7
return 2 + 7 = 9
```

mystery(14, 6)

```
a = 14
b = 6
myst_rest = mystery(8, 6) = 5
return 2 + 5
```

mystery(8, 6)

```
a = 8
b = 6
myst_rest = mystery(2, 6) = 3
return 2+3
```

mystery(2, 6)

```
a = 2
b = 6
myst_rest = mystery(-4, 6) = 1
return 2+1
```

mystery(-4, 6)

```
a = -4
b = 6
return 1
```

3-2) 9

3-3) 6 (5 mystery() and 1 main())

3-4)when $b \leq 0$, the infinite loop occurs because $a - b$ doesn't change or always gets a positive number. Thus, there is no base case that $a < 0$.

Problem 4: Using recursion

```
public static void printReverse(Object[] arr, int i) {
    if (arr == null || i < 0) {
        return;
    }
    System.out.println(arr[i]);
    printReverse(arr, i-1);
}
```
